

Lab 1

Array, constructor and array

1. Write a program to find whether the alphabet is vowel or consonant using switch statement
2. Create a class "Account" with two overloaded constructors. The first constructor is used for initializing the name of account holder, the account number and the initial amount in the account. The second constructor is used for initializing the name of the account holder, the account number, the addresses, the type of account and the current balance. The account class is having methods Deposit(), withdraw(), and Get_Balance(). Make the necessary assumption for the data members and return types of the methods. Create objects of Account class and use them.
3. Write a java program to create Rectangle class with data member length and breadth. Include methods getData() and displayArea() in the class. Finally create an object of Rectangle class and display its area.
4. Design a java class name cylinder with private fields for radius and height, including methods to set these fields, calculate the volume and display the dimensions and volume. In the main method, create two cylinder objects with different dimensions and display their details.
5. Write a java program to find sum and average of all elements in an array.
6. Write a java program to enter 3 * 3 matrices and calculate the sum of given matrices.
7. Write a java program to draw following pattern
8. Write a program to find nth term of Fibonacci sequence.
9. Write a program to input a number and display whether it is prime or not.
10. Create a class Distance with private variables feet of type integer and inches of type floating point. Use suitable constructor and methods for adding and comparing two distance objects. [Hint 1feet = 12 inch]
- 11.
